## **RSE Curriculum**

Gesellschaft für Informatik deRSE Julian Dehne Florian Goth Jan Phillip Thiele Jan Linxweiler Anna-Lena Lambrecht

# 1 WORK IN PROGRESS THIS IS NOT THE OFFICIAL STATEMENT OF THE COMMUNITY BUT THE CURRENT VERSION

## 2 Why a RSE Curriculum?

The term Research Software Engineer, or RSE, emerged a little over 10 years ago as a way to represent individuals working in the research community but focusing on software development. The term has been widely adopted and there are a number of high-level definitions of what an RSE is. However, the roles of RSEs vary depending on the institutional context they work in. At one end of the spectrum, RSE roles may look similar to a traditional research role. At the other extreme, they resemble that of a software engineer in industry. Most RSE roles inhabit the space between these two extremes.

For the purpose of creating an RSE-Master Programm we identify the RSE as a person who creates or improves research software and/or the structures that the software interacts with in the computational environment of a research domain. In this spectrum we see skilled team member who may also choose to conduct own research as part of their role. But on the other end we also see paths for an RSE to specifically focus on a technical role as an alternative to a traditional research role because they enjoy and wish to focus on the development of research software.

For this task, to support research with/in the creation of digital tools, we structure this sample curriculum along three pillars (Goth et al. 2024):

- research skills: these are competencies that enable an RSE to effectively participate in the research domain.
- technical skills: these are competencies, that enable an RSE to create effective tools for research
- communication skills: these are skills that enable an RSE to effectively work and communicate with its peers and stakeholders across multiple domains.

## 3 Balancing Computer Science Fundamentals with Application Demands

Research Software Engineering is a fast-growing field and the curriculum should engender the development of both experts in RSE (Fachexperten), and multidisciplinary researchers that are capable of transferring high-level software-engineering concepts to their respective domains. This can be mapped to the typology of the German Computer Science Association (GI). (Gesellschaft für Informatik e.V. (GI) 2016) defines computer science programs with a three-fold typology:

- Type 1: Computer Science Programs: Computer Science is solely responsible.
- Type 2: Computer Science Programs with a Specific Application Area: Computer Science is responsible in coordination with the participating application discipline.
- Type 3: Interdisciplinary Programs with a Computer Science Component Equal in Weight to Other Participating Disciplines: Computer Science shares responsibility jointly with the participating disciplines.

Fully qualified computer science experts with a focus on research software fit type 1 of CS programs. Interdisciplinary researchers where the computer science background is rivalled by the domain expertise fit the type 3. (At this point) the curriculum tries to support both aspects equally with two branches (or profiles) of the curriculum focusing on the different weights. However, both profiles share common modules and concepts such as the idea to teach RSE-specific Open Science Tooling, an advanced Software Engineering module with specific patterns and modelling techniques for RSE and dual-lab and dual-thesis ideas, where RSE-students interface with a domain or industry field to apply their cross-cutting research skills.

#### 3.1 Research skills

TODO add text here

Research skills are implemented in the following components:

- mnt\_project (TODO work/elaborate on naming, add cross-reference)
- mnt wildcard
- rse thesis

#### Technical skills are implemented in:

- $\bullet \ {\rm gen\_datascience}$
- gen\_programming
- $\bullet$  gen\_softwareengineering
- rse\_softwareengineering
- rse\_programming

(TODO check if technical training assumes too big a role)  $communication\ skills$  are implemented in:

- $\bullet$  rse\_management
- mnt\_project
- $\bullet$  rse\_theory

#### 4 Ideas

Electronic Lab course. Heard of this in Erlangen for physics. Talks about ELN among other things.

#### 4.1 Original Motivation

The target audience for such a master's programme would be students holding a bachelor's degree from a domain science, which we will call **home domain** in the following.

There is explicitly no restriction on the candidates' home domain: it may be from the STEM disciplines, life sciences, humanities or social sciences. Candidates with a bachelor's degree in computer science are also explicitly included, although we acknowledge that their master's programme should include adaptations to make their interaction effective with other domain scientists.

In order to give the future RSE the necessary breadth, we expect this to be a four semester curriculum.

The curriculum is formed from a combination of modules, some of which are core modules teaching essential skills that must be completed by all students. Other modules introduce more specialised concepts and skills.

During the master's programme, students should pick an RSE specialisation from the list in this paper and attend these additional modules to deepen their knowledge in the field.

Core modules are of course drawn from the three pillars of the RSE and can be categorised accordingly.

#### 4.1.1 Software / Technical Skills

#### • Foundational module

Introduction to programming: Emphasising use cases over programming paradigms, students learn at least two languages:

- A language that facilitates prototyping and data processing e.g., Python or R

A language for designing complex, performance-critical systems e.g., C/Cpp
 This exposes them to computers in a hands-on fashion and is the foundation for DOCBB, DIST.

#### • Computing environment module

Programming languages are not enough to work in a landscape of many interconnected software components. Hence, we require something like software craftsmanship:

 Tools: Unix shell, version control systems, build systems, documentation generators, package distribution platforms, and software discovery systems
 This strengthens skills in DIST, DOCBB, SWREPOS, SRU.

#### • Software engineering module

Develop foundational software engineering competencies:

- Requirements engineering
- Software architecture and design
- Implementation, quality assurance, and software evolution
   Emphasising and strengthening DOCBB, DIST on a more abstract level.

#### 4.1.2 Research Skills

#### • Optional domain mastery module

Additional minor research courses; students with a home-domain already have the research part well-covered.

#### · Research tools module

Teach tools used to distribute and publish software, and introduce domain-specific data repositories, gaining foundational knowledge in SRU, SP, DOMREP.

#### • Meta-research module

Teach how research works: Introduce the research life cycle, the data life cycle, and the software life cycle abstractly.

#### 4.1.3 Communication Skills

#### Project management methods

Teach project management methods that are useful in science, such as agile ones PM.

#### • Communication skills module

Courses focusing on:

- Interdisciplinary communication
- Interacting across cultures
- Communication in hierarchies

 Supporting end users effectively All facets of the USERS skill.

#### · Teaching module

Covers topics to effectively design courses and teaching material for various digital tools, strengthening the TEACH skill.

#### 4.2 Hands-On Practice

RSE work also involves craftsmanship skills. Hands-on practice is integral.

- At least two lab projects are required within the mandatory curriculum.
- These should be team-based and involve a question from a domain science.
- Ideally, projects cover both the candidate's home domain and another domain.
- Projects should stem from collaborations with scientists within the institution, with RSE students taking on a consultant role.

This setup strengthens TEAM, TEACH, USERS and likely also MOD through interaction.

To emphasise exposure beyond their bachelor's domain, RSEs should support their non-home-domain project with introductory courses from that discipline. This encourages adapting vocabulary and thinking—an aspect of MOD.

#### 4.3 Optional Modules and Specialisations

To align with the specialisations listed in this paper, example optional modules include:

- HPC engineering / parallel programming
- Numerical mathematics / scientific computing
- Web technologies
- Data stewardship
- AI models / statistics
- Community management / training

#### 4.4 Master's Thesis

The programme concludes with a master's thesis that should:

- Be dual-supervised by an RSE project supervisor and a domain supervisor
- Answer a relevant research question strengthening NEW using computational methods

• Include software development as a required, gradable deliverable

The RSE supervisor ensures and grades the software craftsmanship. This ensures the effective application of RSE skills in an actual research environment.

#### 5 Possible Job Roles for an RSE

#### 5.1 Open Science RSE

Open science and FAIRness of data and software are increasingly important topics in research, as exemplified by the demand of an increasing amount of research funding agencies requiring openness. Hence, an Open Science RSE is required to have a deeper knowledge in **Research Culture (RC)** and how to distribute software publicly (**Software Reusability (SRU)**, **Software Publication (SP)**). Open Science RSEs can help researchers navigate the technical questions that come up when practising Open Science, such as:

- "How do I make my code presentable?"
- "How do I make my code citable?"
- "What do I need to do to make my software FAIR?"
- "How do I sustainably work with an (international) team on a large code base?"

Like the Data-focused RSE, they have a deep understanding of Research Data Management (RDM) topics.

#### 5.2 Project/Community Manager RSEs

When research software projects become larger, they need someone who manages processes and people. In practice, this concerns change management for code and documentation, and community work to safeguard usability and adaptability, but also handling project governance and scalable decision-making processes. This gap can be filled by people who invest in the **Project Management (PM)**, **User Support (USERS)**, and **Team Management (TEAM)** skills.

Building a community around a research project is an important building block in building sustainable software (Segal 2009), so these RSEs play an important role, even if they do not necessarily touch much of the code themselves.

#### 5.3 Teaching RSEs

RSEs interested in developing their **Teaching (TEACH)** skill can focus on teaching the next generation of researchers and/or RSEs and will play a vital role in improving the quality of research software. They need to have a good understanding of all RSE competencies relevant to their domain and additionally should have experience or training in the educational field.

## 5.4 User Interface/User Experience Designers for Research Software

Scientific software is a complex product that often needs to be refined in order to be usable even by other scientists. To facilitate this, there are people required that specialise in the **Documentation & Best Practices (DOCBB)** and probably the **Distribution (DIST)** competency with a focus on making end-user-facing software really reusable and hence FAIR. This task is supported by strong **Modelling (MOD)** skills to reason about the behaviour of potential users of the software.

## **6 General Study Process**

#### 6.1 Semester 1

| Type     | Description                              | SWS | ECTS |
|----------|------------------------------------------|-----|------|
| Seminar  | RSE Nuts and Bolts I                     | 2   | 3    |
| Lecture  | Wildcard Science I                       | 2   | 3    |
| Lecture  | Basic Programming                        | 2   | 1    |
| Exercise | Basic Programming Exercise               | 4   | 4    |

## 8 Module Descriptions (Inline)

#### 8.1 Master's Thesis Module: Research Software Engineering Thesis

The master's thesis is the culminating component of the RSE programme. In this module, students apply the full spectrum of Research Software Engineering skills in a real-world research setting, demonstrating their ability to independently design, implement, and document a computational research contribution.

The thesis must address a research question in collaboration with a scientific or applied domain, but its core should include a substantial computational component. This may involve software development, data-intensive research, reproducibility infrastructure, or performance engineering — depending on the chosen topic and specialization.

Each thesis must be supervised jointly by:

- A domain expert (e.g., in physics, life sciences, or humanities)
- An RSE mentor (who ensures the quality and relevance of the computational contribution)

Students are expected to follow best practices in software engineering, version control, testing, and documentation. The final submission must include:

- A written thesis describing both the scientific and software contributions
- A structured, reproducible code repository
- A presentation and defense in a thesis colloquium

The colloquium serves as both a public communication exercise and a final evaluation, where students present their project and reflect on challenges and insights gained during the thesis.

Thesis: RSE Master Thesis

**SWS:** 10 **ECTS:** 30

## 9 Wildcard Computational Science

This module offers RSE students the opportunity to deepen their understanding of computational methods specific to a science discipline. Students choose a science module — such as physics, chemistry, biology, or earth sciences — and engage with its computational practices, core questions, and data/software challenges.

The goal is to apply the general competences acquired in the general programming and software engineering courses to the practices and special needs of the chosen discipline. Computational Physics might face different algorithmic or conceptual challenges than computational chemistry. This module is intended for the case that the institution offers such a specialized computational course.

Lecture: Computational Wildcard Science

**SWS:** 2 **ECTS:** 3

Lab: Wildcard Science Lab

**SWS:** 4 **ECTS:** 6

## 10 RSE Management and Communication

#### 10.1 Introduction

This module comprises the communication and management skills that are relevant for working in the interdisciplinary setting of RSE-professionals.

This includes but is not limited to:

- working in a team (see TEAM in (Goth et al. 2024))
- teaching RSE-basics (see TEACH in (Goth et al. 2024))
- project management (see PM in (Goth et al. 2024))
- interaction with users and other stakeholders (see USERS in (Goth et al. 2024))

#### 10.2 Contents

#### · research management

- research cycle
- open science, FAIR, FAIR4RS
- publication workflow: obstacles and embargoes
- legal aspects of research data, e.g. GDPR
- pseudonymization/anonymization methods for data privacy
- public databases

#### • quality control

- requirements engineering
- trying goals with quality: test-driven development
- behavior-driven development, Gherkin-Style acceptance testing
- project folder organization
- code review principles

#### • communication and collaboration

- communication frameworks, e.g. AIDA, RACE, 7 C's
- personality traits and their impact on cooperation
- collaboration frameworks for remote work

- realisation and benefits of pair programming and mob/ensemble programming
- technical English writing skills: writing in issues and merge requests, code review...
- conflict management, e.g. dealing with researchers that do not listen
- how to address relevant stakeholders (i.e. users and SEs) with different background knowledge, experience and expectations
- equity, diversity and inclusion principles

#### • team management

- challenges of transient teams (that only exist for 5-15 hours)
- effects of varying team sizes
- management depending on project size/type
- specialised roles in a software team
- intercultural and interdisciplinary differences
- team management methodologies
- importance of shared values in a RSE team
- dual goals: project vs. personal goal

#### • time and project management

- goal-setting
- project management methods, their strengths and weaknesses
- agile (not necessarily Scrum)
- Lean & Kanban (Small-Batch Philosophies)
- division of tasks into sub-tasks and task-dependencies
- iterative workflows
- continuous delivery
- communication with a manager/supervisor

Lecture: RSE-Management Lecture This is an introductory lecture covering research, project and team management techniques an RSE needs in everyday life. SWS: 2 ECTS: 3

**Exercise**: RSE-Management Exercise This is an exercise to apply and practice the taught methods with case-studys, role-plays etc. **SWS**: 2 **ECTS**: 3

#### 10.3 Module Competences

- Collaboration Explained
- Team Topologies
- Technical Agile Coaching with the Samman method
- Lean Product and Process Development
- Extreme Programming Explained

## 11 Module title

#### 11.1 Introduction

This module provides an in-depth understanding of programming languages and compiler technology. Topics covered include lexical analysis, syntax parsing, code generation, and optimisation techniques for compilers. The course includes both theoretical lectures and practical exercises, culminating in a project where students will build a simple compiler.

#### 11.2 Contents

- Virtualization
- Programming Languages and Design
- Software System Security

#### 11.3 Competences

- describe paradigms and tools for the specification, development, and quality assurance of modern software systems, as well as their application in different contexts
- use various approaches in programming languages and compiler technology

#### 11.4 Examination Methods

- either a written exam (90-100 minutes)
- or an oral examination (20-30 minutes)
- or a project report (20-30 pages)

#### 11.7.1.1 Basic Concepts

- Introduction to computer science, basic concepts of operating systems using UNIX/Linux as an example
- From problem to algorithm: concept of an algorithm, design of algorithms, pseudocode, refinement, brute-force algorithms, models and modeling, graphs and their representation, simple algorithms on graphs, analysis of algorithms (correctness, termination, runtime)
- Implementation of algorithms (e.g., using Python)
- Programming paradigms: procedural, object-oriented, and functional programming; recursion versus iteration
- From program to process: assembly languages, assembler, compiler, interpreter, syntax and semantics of programming languages
- Limits of algorithms: computability, decidability, undecidability

Lecture: Basic Programming

**SWS:** 2 **ECTS:** 1

Exercise: Basic Programming Exercise

**SWS:** 4 **ECTS:** 4

#### 11.7.2 Applied Programming

#### 11.7.2.1 Procedural Programming Concepts

Programming with an imperative-procedural language (such as C):

- Data types, type casting, control structures, functions and procedures, parameter passing paradigms, call stack
- Pointers, arrays, strings, structured types
- Errors and their handling
- Dynamic memory management
- Program libraries

#### 11.7.2.2 Programming in an Object-Oriented Language (e.g., Java)

• Classes, objects, constructors

• Inheritance, polymorphism, abstract classes/interfaces

• Exceptions and exception handling

• Namespaces (packages)

• Generic classes and types

• Program libraries

Lecture: Applied Programming

**SWS:** 2 **ECTS:** 1

Exercise: Applied Programming Exercise

**SWS:** 4 **ECTS:** 4

#### 11.8 Module Competences

## 11.9 Sources & Implementations:

#### 11.9.1 Curricula

• Computing Curricula 2020

#### 11.9.2 Courses

- UP Grundlagen der Programmierung
- UP Praxis der Programmierung
- Python for Psychologists
- Grundlagen der Informatik

#### 11.9.3 Programs

• UP Computational Science Master

## 12 Formal Methods in Software Engineering

#### 12.1 Introduction

This module covers advanced topics in Software Engineering with a focus on formal methods for specification, modeling, and verification.

#### 12.2 Contents

The module includes the following topics:

- Software Quality Assurance: Formal methods for specifying and verifying system properties.
- Service Engineering: The role of formal methods in service-based architectures.
- System Design: Use of formal methods in system design, focusing on specification and verification.

#### 12.3 Competences

- Understand and apply formal methods in system design and software engineering.
- Analyse theoretical and practical problems in modeling and implementation using formal methods.

#### 12.4 Examination Methods

- Either a 90-minute written exam.
- Or a 20-30 minute oral examination.

**Lecture**: Formal Methods in Software Engineering Lecture covering formal methods in system design, software specification, and verification. **SWS:** 2 **ECTS:** 2

**Exercise**: Formal Methods Exercise Exercise for hands-on application of formal methods in system modeling and analysis. **SWS**: 2 **ECTS**: 4

#### 12.5 Module Competences

| ID     | Description                                                                                                                | Disciplines         | Prerequisites                                  | Evidence                                                          | Author                        | Source |

#### 13 RSE Nuts and Bolts

#### 13.1 Introduction

This module, inspired by the MIT Missing Semester, addresses the "nuts and bolts" often missing from traditional academic training in computing. It aims to provide students with practical skills and conceptual understanding for building robust, maintainable, and reproducible research software—key competencies in Research Software Engineering (RSE).

#### 13.2 General Competencies

The module begins with general-purpose computing tools and techniques that are foundational for any research software engineer:

- Shell tools and scripting
- Command-line environments
- Editors and IDEs (e.g., Vim)
- Version control (Git)
- Data wrangling
- Debugging and profiling
- Metaprogramming
- Security and cryptography

#### 13.3 RSE-Specific Topics

Building on these foundations, the module introduces RSE-specific concepts and good practices:

- Version control and collaboration
  - Git for code history, collaboration, and issue tracking
- Virtualization concepts
  - Containerization and environment management

#### • The Data Life Cycle

- Managing research data and understanding data provenance

#### Good coding practices

- Reproducible and testable code
- Meaningful documentation and error messages
- Modular software design
- Performance-conscious coding
- Easily installable and distributable software
- Coding standards, formatting, and linting

#### • Software management planning

- Writing Data and Software Management Plans
- Sustainable development and community involvement

#### • Low-level programming

- Introduction to a compiled language (e.g., C) to expose hardware-level concerns and efficient memory management

#### • Long-term software maintenance

- Version tracking, bug management, and sustainability strategies
- Building and maintaining research software communities

#### 13.4 Beyond the Basics

Finally, the module touches on practices that support the scholarly nature of research software:

- Software publication and citation (see SP in (Goth et al. 2024))
- Use of domain-specific repositories and registries (see DOMREP in (Goth et al. 2024))

By the end of this module, students will be well-equipped to design, develop, document, and maintain research software that meets high standards of quality, sustainability, and reproducibility.

The module is made up of two seminars that the students take at different stages in their master's program: In the first seminar during their first semester, students mainly learn new concepts and get to know essential tools, whereas the second seminar in the third semester focuses on teaching others about research software and the development process of it (see TEACH in (Goth et al. 2024)).

**Seminar**: RSE Nuts and Bolts I This is an introductory class to essential techniques an RSE needs in everyday life. **SWS**: 2 **ECTS**: 3

**Seminar**: RSE Nuts and Bolts II This is an advanced class of RSE techniques that includes a teaching component as part of the preparation for working as an RSE in interdisciplinary teams. **SWS**: 2 **ECTS**: 3

#### 13.5 Module Competences

## 13.6 Sources & Implementations:

### 13.6.1 Courses

- MIT Missing Semester
- CodeRefinery
- INTERSECT Training Materials
- Digital Research Academy Materials (Git, HPC, Reproducibility, Research Software)
- Building Better Research Software (SSI)
- Docker for neuroscience (jupyter book)

## 13.7 RSE Computing

RSEs with expertise in HPC and other performance-critical computing domains specialize in optimizing code for efficient execution across various platforms, including clusters, cloud, edge, and embedded systems. They understand parallel programming models, hardware-specific optimizations, profiling tools, and platform constraints such as memory, energy, and latency.

Their skills enable them to adapt software to diverse infrastructures, manage complex dependencies, and support researchers in accessing and using advanced computing resources effectively and sustainably.

#### 13.7.1 Basic Scientific Computing

#### 13.7.1.1 Module Overview

This module provides an entry-level yet rigorous foundation in scientific computing for graduate students and researchers who need to **design**, **implement**, **and evaluate computational experiments**. Learners gain an awareness of the numerical underpinnings of modern simulation and data-driven research, with an emphasis on writing *reproducible*, *efficient*, and trustworthy code.

### 13.7.1.2 Intended Learning Outcomes

By the end of the module participants will be able to

- 1. Benchmark small programs and interpret performance metrics in a research context.
- 2. Explain how approximation theory and floating-point arithmetic affect numerical accuracy and stability.
- 3. Identify when to use established simulation libraries (e.g. BLAS/LAPACK, PETSc, Trilinos) instead of custom code.
- 4. Write simple GPU kernels and describe the core principles of accelerator programming.
- 5. Submit and monitor batch & array jobs on a mid-size compute cluster.
- 6. Describe common HPC challenges—such as I/O bottlenecks, threading, and NUMA—and propose mitigation strategies.
- 7. Maintain research software through continuous benchmarking.

### 13.7.1.3 Syllabus (Indicative Content)

| Week | Theme                    | Topics                                                            |
|------|--------------------------|-------------------------------------------------------------------|
| 1    | Benchmarking & Profiling | Timing strategies · micro vs. macro benchmarks · tooling overview |
| 2    | Precision &              | IEEE-754 recap · conditioning & stability · error                 |
|      | Approximation            | propagation                                                       |
| 3    | Scientific Libraries     | BLAS/LAPACK anatomy $\cdot$ hierarchical I/O libraries $\cdot$    |
|      |                          | overview of PETSc/Trilinos/Hypre                                  |
| 4    | GPU Primer               | Kernel model · memory hierarchy ·                                 |
|      |                          | CUDA/OpenCL/PyTorch lightning intro                               |

| Week | Theme                   | Topics                                                                   |
|------|-------------------------|--------------------------------------------------------------------------|
| 5    | Working on a<br>Cluster | Slurm basics · job arrays · job dependencies · simple Bash launchers     |
| 6    | HPC Pitfalls            | I/O throughput $\cdot$ thread oversubscription $\cdot$ NUMA awareness    |
| 7    | Software<br>Maintenance | Regression + performance tests $\cdot$ continuous benchmarking pipelines |

### 13.7.1.4 Teaching & Learning Methods

Short lectures (30%) are coupled with hands-on labs (70%). Students complete **weekly note-books** and a **mini-project** that reproduces and optimises a published computational result.

#### 13.7.1.5 Assessment

| Component                             | Weight     | Details                                                   |
|---------------------------------------|------------|-----------------------------------------------------------|
| Continuous labs<br>Final mini-project | 40%<br>60% | Weekly graded notebooks Report, code, and benchmark suite |

### 13.7.1.6 Prerequisites

• Basic programming in Python, C/C++, or Julia

• Undergraduate calculus & linear algebra

### 13.7.1.7 Key Resources

## 13.10 Classical Software Engineering

To summarise the vast range of the skills a software engineer is typically equipped with, we refer to the Guide to the Software Engineering Body of Knowledge (Bourque, Fairley, and IEEE Computer Society 2014). Because research software engineering is an interface discipline, RSEs are often stronger in topics more commonly encountered in research software contexts (e.g., mathematical and engineering foundations) than in other areas (e.g., software engineering economics). However, they bring a solid level of competence in all software engineering topics. Therefore, RSEs can set and analyse software requirements in the context of open-ended, question-driven research. They can design software so that it can sustainably grow, often in an environment of rapid turnover of contributors. They are competent in implementing solutions themselves in a wide range of technologies fit for different scientific applications. They can formulate and implement various types of tests, they can independently maintain software and automate operations of the integration and release process. They can provide working, scalable, and future-proof solutions in a professional context and with common project and software management techniques, adapted to the needs of the research environment. Finally, as people who have often gained significant research experience in a particular discipline, they combine the necessary foundations from their domain with software engineering skills to develop complex software. (Goth et al. 2024)

This module tries to lay the foundations for the advanced RSE software engineering training.

# 14 Security, Information and Complexity

### 14.1 Introduction

This module deals with correctness, security and complexity of algorithms.

### 14.2 Contents

- Methods for secure and reliable transmission and processing of information, errorcorrecting coding methods
- Fundamentals of cryptographic systems, methods for information analysis, complexity aspects, applications
- Necessary foundations of mathematics and complexity theory are introduced alongside the topics

## 14.3 Competences

- Understand the mathematical foundations of secure and reliable information processing and their complexity-theoretical basis.
- Are familiar with the fundamentals of error-protected transmission and storage of data.
- Are capable of analysing the correctness, security, and complexity of methods

### 14.4 Examination methods

- Either a written exam (90 minutes).
- Or an oral examination (30 minutes).

# 15 Distributed Systems

### 15.1 Introduction

This module deals with distributed IT systems.

### 15.2 Contents

The module covers a selection of the following topics:

- Reliability of distributed systems: Concepts of distributed file systems, synchronization techniques for reliable distributed applications, concepts of load balancing in high-availability clusters,
- Example: Sensor networks: Routing in sensor networks, operating systems for sensor networks, security in sensor networks,
- Secure internet protocols (IP security (IPsec), Pretty Good Privacy (PGP), Secure Socket Layer (SSL), Transport Layer Security (TLS), Secure Shell (SSH), DNS security (DNSsec)), secure IPv6 networks.

## 15.3 Competences

- can evaluate existing distributed systems in terms of reliability and security and identify vulnerabilities.
- can correctly identify reliability and security requirements when designing new distributed systems and consider them early in the development process.

### 15.4 Examination Methods

- either 120 min written exam
- or 20-30 min oral examination

Lecture: Distributed Systems

**SWS:** 2 **ECTS:** 2

Exercise: Distributed Systems Exercise

## 15.7 RSE-Software Engineering

This module extends the Classical Software Engineering Module with research specific learnings. This includes but is not limited to

- software re-use (see SRU in (Goth et al. 2024))
- creating documented code building blocks (see DOCBB in (Goth et al. 2024))
- building distributable software (see DIST in (Goth et al. 2024))
- research specific programming languages
- research specific code requirements (scalability, functional programming, ...)
- Adapting the software life cycle to research (see SWLC in (Goth et al. 2024))
- Software behaviour awareness and analysis (see MOD in (Goth et al. 2024))
- Research specific Engineering Patterns

# 16 RSE Philosophy

### 16.1 Introduction

The RSE master program is more than a computer science specialisation for researchers. People working as RSE are often involved in digitalization projects, institutional development or other non-technical tasks.

## 16.2 Contents

For a university level study program it is fitting that students learn an abstract high-level understanding of their field so that they can adapt technical models, communication frameworks and policy recommendations to the complex cases. For this they need a solid understanding in some of the more theoretical fields such as ...

- philosophy of science
- sociology of technology
- ethics and artificial intelligence
- human computer interaction
- digital humanities

## 16.3 General Competences

This module conveys competences in areas such as but not limited to ...

- conducting and leading research (NEW)
- understanding the research cycle (RC)
- interaction with users and stakeholders (USERS)

Seminar: RSE Philosophy This is an introductory class to ... SWS: None ECTS: None

### 16.6 Science Lab Module

Applied Research Software Engineering in MINT Sciences

This lab module provides students with a hands-on opportunity to apply research software engineering principles to real-world scientific problems from the MINT disciplines (Mathematics, Informatics, Natural Sciences, and Technology). Students work on projects originating from active research contexts — such as simulations in physics, data analysis in chemistry, modeling in biology, or

Lab: Science Lab SWS: 4 ECTS: 6

### 16.7 Wildcard Science Module

This module offers RSE students the opportunity to deepen their understanding of a scientific discipline outside of their home domain. Students choose a science module — such as physics, chemistry, biology, or earth sciences — and engage with its research practices, core questions, and data/software challenges.

The goal is to help students become better collaborators by gaining first-hand exposure to the terminology, logic, and needs of another scientific domain. This broadens the student's ability to apply RSE skills in interdisciplinary teams and unfamiliar environments.

The module may consist of lectures, lab sessions, and domain-specific mini-projects. RSEs are encouraged to reflect on how software engineering, data handling, reproducibility, and tooling intersect with the chosen discipline.

This module is deliberately flexible to accommodate institutional offerings and student interests as well as providing the option to stay attached to the identity of the chosen discipline.

Lecture: Mathematical Foundations of Data Science The module provides mathematical foundations in the field of Data Science. Topics include a selection from the areas of graph analysis, stochastic models, and signal analysis using wavelets. SWS: 4 ECTS: 6

## 17.7 Statistical Data Analysis

This module focuses on the statistical study and quantitative analysis of the dependence between observed random variables (e.g., yield/production settings; lifespan/treatment type and injury type). Essential foundations for the statistical treatment of such relationships are provided by the linear regression model, which is studied in detail in the first part of the lecture. Within this framework, topics such as estimation, testing, and uncertainty quantification (analysis of variance) are addressed. In the second part, an introduction to advanced methods and approaches for examining relationships is offered, including nonlinear and nonparametric

regression models. Additionally, questions of classification and dimensionality reduction are covered.

# 18 Glossary

C A general-purpose programming language often used for system-level development.

**Cpp** C++ — an extension of C that supports object-oriented programming.

**DIST** Software distribution — the practice of packaging and delivering software and its dependencies.

**DOCBB** Documentation and best practices — ensuring code is understandable and maintainable.

**DOMREP** Domain repositories — platforms that store and share domain-specific research data.

**HPC** High-Performance Computing — using supercomputers and parallel processing for complex tasks.

**MOD** Modularity — the design principle of separating software into interchangeable, functional components.

**NEW** Novel research — work that contributes original insights to a scientific domain.

**PM** Project Management — planning, executing, and overseeing projects effectively.

Python A high-level programming language widely used in data science and scripting.

R A programming language and environment for statistical computing and graphics.

**RSE** Research Software Engineer — someone who applies software engineering skills to scientific research.

**SP** Software publication — the process of preparing and disseminating software artifacts.

**SRU** Software reuse — the practice of using existing software components in new projects.

**STEM** Science, Technology, Engineering, and Mathematics.

**SWREPOS** Software repositories — systems for storing and managing software code and versions.

**TEAM** Teamwork — the ability to collaborate effectively in a group setting.

**TEACH** Teaching — the skill of communicating knowledge and helping others learn.

**USERS** End users — the scientists or researchers who rely on software tools.
